

iCorps Guardian Program

Comprehensive Data Backup

Business Continuity by Design

iCorps Guardian is an enterprise-class, multi-tiered business continuity backup and recovery solution that allows you to select the level of protection and recovery options that fit your specific business needs. Guardian provides full data protection, long-term retention, and redundant backups against natural and technology related disasters. The program's multi-tiered approach includes:

Image-Based Backups

iCorps Guardian uses image-based screenshots of your workstation and servers. These screenshots support machine, application, and system restoration.

Hybrid Cloud

Once local backup is complete, data is transferred to the cloud. Our remote cloud storage and off-site recovery enable you to restore your environment.

Virtual Environments

In the event of on-premise damage, iCorps will spin up virtual replicas of your computing environment. Employees can access these virtual servers online.

Testing & Support

Guardian tests and verifies your backups daily. This ensures you're prepared for a quick and successful recovery.

Predictable Cost

Pay a monthly flat fee and one-time nominal start-up cost. This digital environment has no physical storage requirements.
